

Abstract of the Disclosure

2 A motorcycle or bicycle having a fork with swappable trail adjustment blocks which hold
3 the front axle to the fork. Trail can be adjusted without removing the forks or even loosening
4 them in the triple clamps, and without altering ride height or rake angle. Brake caliper mounts
5 are swapped when the trail adjustment blocks are swapped, moving the brake calipers the same
6 distance and direction as the axle, to maintain a constant radial distance from the axle to the
7 brake pads. The brake caliper mounts pivot on the forks, enabling the brake calipers to be swung
8 outward so the wheel can be changed without removing the brake calipers from the forks.
